Distributor/Tack/Prime Work Group

Wayne Rilko, P.E.
State Materials Office
Topics for today’s meeting:

- Bad tack shots. What to do? What not to do?
- Pavement surface receiving the tack coat
- Slippage
- Proposed specification language:
  - Clean the distributor tank
  - Verify the meter
  - Increase the tack spread rate for new-on-new construction
  - Coat the surface completely and uniformly
  - Do not dilute tack products
Bad tack shot. What to do? What not to do?
Distributor/Tack/Prime Work Group

Shoot a short ‘test’ section just long enough to get the truck and pump up to speed. If uneven, stop and make adjustments.
Don’t back up and reshoot without making adjustments. That gives another set of corn rows.
Be sure the truck is ready for the shot.
Check the spray bar and nozzles.

Good coverage - triple lap
Except for the outside nozzles, each point on the pavement surface is covered by exactly three spray nozzles - a triple lap. For a given nozzle flow rate, this results in a greater application rate than for a double lap.

Distributor/Tack/Prime Work Group

Do not tack on a dirty surface. This causes pick up by the trucks and construction equipment.
Distributor/Tack/Prime Work Group

Do not tack on a dirty surface. This causes pick up by the trucks and construction equipment.
Do not tack on a dirty surface. This causes pick up by the trucks and construction equipment.
Distributor/Tack/Prime Work Group

Be sure the tack breaks and sets.
Distributor/Tack/Prime Work Group

This.
Distributor/Tack/Prime Work Group

Not this.
Distributor/Tack/Prime Work Group

The Work Group was formed to address three main issues:

- Distributor tank calibration
- Distributor truck/meter system calibration
- Increase tack application rates

The existing specification requires one time calibration of the tank and no calibration requirement for the meter.

Our tack application rates are low when compared to other States.
Distributor/Tack/Prime Work Group

Proposed Specification Revisions
Cleaning the distributor tank for accurate calibration:

300-3.1.1 Tank Cleaning: Clean the distributor tank at a minimum of every twelve months and whenever the product type in the tank is changed. Remove all emulsion and asphalt material during cleaning. Additionally, clean the distributor tank if the quality of the tack or prime shot diminishes or buildup causes the calibration of the tank to be affected.
Checking of the distributor metering system accuracy:

300-9.2.1 Verification of the Meter: When using a meter to control the tack or prime application rate, manually measure the volume in the tank at the beginning and end of the application area for a specific target application rate. Perform this operation at a minimum frequency of once per production shift. Resolve any differences between the manually measured method and the meter to ensure the target application rate is met in accordance with this specification section. Adjust the application rate if the manually measured application rate is greater than plus or minus 0.01 gallons per square yard when compared to the target application rate.
Raising the tack application rate for new-on-new construction:
Current = 0.04 gal./sq. yd.
Proposed = 0.05 gal./sq. yd.

* Special Order
Addtional changes:

- Where the Engineer requires a tack coat prior to laying a bituminous surface, apply the tack coat as specified herein below. **Coat the surface completely and uniformly with tack.**
- Change ‘spread rate’ to ‘application rate’.
- Do not dilute tack.
Good tack coat coverage
Distributor/Tack/Prime Work Group

Many thanks to all who participated in the work group- equipment manufacturers, material suppliers, contractors and FDOT personnel. We would not have this amount of progress without your efforts. We are all on the same page. There is more to do. This is an ongoing process. New people join the paving industry every day. They need training and guidance. Thank you.
